

New flexible grinding pads

DIAMOND Products has launched a new range of flexible grinding pads for use on hand held grinding machines.

The new range of Diamond Products flexible metal dot pads consist of round diamond segments housed in a flexible rubber pad and operate on the same system as the company's range of flexible polishing pads.

The system uses a rubber backing pad which has Velcro on the front and is screwed onto the grinder. The flexible polishing pads attach to the front of this backup pad making for ease of change between grit sizes. Until now, if a job required pre-grinding, a cup grinder was used.

The pads offer the user flexibility when grinding, which is often not possible with the cup grinders. The pads are available in four different grit sizes, 30 grit, 60 grit, 150 grit and 300 grit.

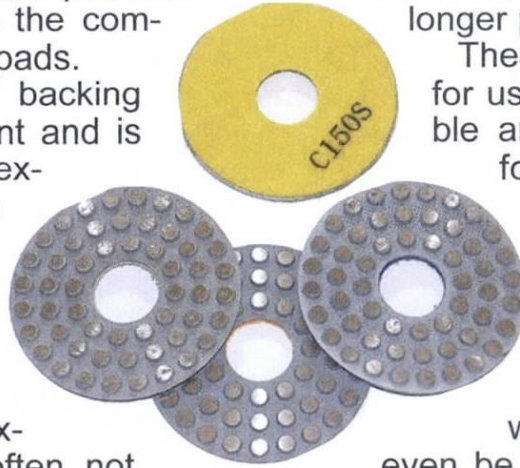

The pads from can be used for grinding off excess material, and to remove foreign mate-

rial on the concrete surface, as well as for pre-grinding before commencing with polishing.

The flexible grinding pads are suitable for floor grinding, tool mark removal, and preparation for decorative concrete resurfacing. They offer a faster grinding speed and longer product life.

These grinding pads are ideal for use on concrete, granite, marble and terrazzo. They are ideal for marble work because, unlike a cup grinder, they do not have rigid segments and therefore leave a far smoother finish on rounded surfaces. They are also perfect for all concrete work, and the finer grit can even be used on porcelain tiles and more delicate materials.

The flexible grinding pads are currently only available with a diameter of 100 mm for use on small grinding machines.
