

Advanced concrete floor cutting equipment

Industrial flooring expert CLF has undertaken a number of large-scale industrial flooring projects throughout South Africa making use of state-of-the-art concrete cutting equipment supplied by Diamond Products, a specialist in the manufacture, assembly, sale and support of diamond tools and equipment for industrial applications.

CLF director Peter Norton says that the company has been specialising in concrete floor cutting applications for the past five years. This has become an important element of its business – “largely due to the superior quality and reliability of the Diamond

Products range of cutting and coring blades, which we have been using since day one,” Norton says.

He reports that CLF has, to date, cut more than 90 000 linear metres of concrete flooring for high-profile projects – at Proctor and Gamble, Consol Glass, and in the Gauteng Freeway Improvement Project, for example – using the Diamond Products range exclusively. “The quality and service provided by Diamond Products is unrivalled. With excellent pricing and product availability, the overall benefits are ultimately transferred to our clients, who have all expressed their satisfaction,” Norton says.

Diamond Products director Brian Clark believes that the close working partnership between the two companies has been highly beneficial. “CLF is a leader in its field and our strong working relationship ensures optimum efficiencies.”

Darryl Gray, Diamond Products co-director, says the company prides itself on supplying the highest quality products to the South African market, complete with safety and maintenance training – at no extra cost – as part of its after-sales service package.
